Natural Language Processing & Word Embeddings

LATEST SUBMISSION GRADE

100%

1.	 Suppose you learn a word embedding for a vocabulary of 10000 words. Then the embedding vectors should be 10000 dimensional, so as to capture the full range of variation and meaning in those words. True False 					
	✓ Correct The dimension of word vectors is usually smaller than the size of the vocabulary. Most common sizes for word vectors range between 50 and 400.					
2.	What is t-SNE?	1/1 point				
	An open-source sequence modeling library					
	A supervised learning algorithm for learning word embeddings					
	A linear transformation that allows us to solve analogies on word vectors					
	A non-linear dimensionality reduction technique					
	✓ Correct Yes					

3. Suppose you download a pre-trained word embedding which has been trained on a huge corpus of text. You then use this word embedding to train an RNN for a language task of recognizing if someone is happy from a short snippet of text, using a small training set.

x (input text)	y (happy?)
I'm feeling wonderful today!	1
I'm bummed my cat is ill.	0
Really enjoying this!	1

Then even if the word "ecstatic" does not appear in your small training set, your RNN might reasonably be expected to recognize "I'm ecstatic" as deserving a label y=1.

O False

True

Yes, word vectors empower your model with an incredible ability to generalize. The vector for "ecstatic" would contain a positive/happy connotation which will probably make your model classify the sentence as a "1".

	~	e_{bo_i}	$e_{oy}-e_{girl}pprox e_{brother}-e_{sister}$	
	,	/	Correct Yes!	
	~	e_{bo}	$e_{oy} - e_{brother} pprox e_{girl} - e_{sister}$	
	,	~	Correct Yes!	
		e_{bo}	$c_{oy} - e_{brother} pprox e_{sister} - e_{girl}$	
		e_{bo}	$c_{oy}-e_{girl}pprox e_{sister}-e_{brother}$	
			be an embedding matrix, and let o_{1234} be a one-hot vector corresponding to word 1234. Then to get the embedding d 1234, why don't we call $E*o_{1234}$ in Python?	nt
	0	No	one of the above: calling the Python snippet as described above is fine.	
	0	The	ie correct formula is $E^Tst o_{1234}.$	
	0	Thi	is doesn't handle unknown words (<unk>).</unk>	
	•	It is	is computationally wasteful.	
	,	/	Correct Yes, the element-wise multiplication will be extremely inefficient.	
			res, the element wise manaplication will be extremely memberni.	
6.	on t	this	learning word embeddings, we create an artificial task of estimating $P(target \mid context)$. It is okay if we do poorly artificial prediction task; the more important by-product of this task is that we learn a useful set of word lidings.	nt
	0	Fals	lse	
		/	Correct	
7.		sen	word2vec algorithm, you estimate $P(t \mid c)$, where t is the target word and c is a context word. How are t and c in from the training set? Pick the best answer.	nt
	0		s the one word that comes immediately before $t.$	
	\circ		s a sequence of several words immediately before t .	
	0		s the sequence of all the words in the sentence before $t.$	
		Са	and t are chosen to be nearby words.	
		/	Correct	
	use	s the	se you have a 10000 word vocabulary, and are learning 500-dimensional word embeddings. The word2vec model ne following softmax function:	nt
	P(t	$t \mid c$	$e^{i\omega} = rac{e^{ heta_I^T e_c}}{\sum_{t=1}^{t=0000} e^{ heta_I^T e_c}}$	
			of these statements are correct? Check all that apply.	
		Afte	ter training, we should expect $ heta_t$ to be very close to e_c when t and c are the same word.	

	$ ot\hspace{-1em} egin{array}{c} \theta_t \text{ and } e_c \text{ are both trained with an optimization algorithm such as Adam or gradient descent.} \end{array}$	
	✓ Correct	
	$ ightharpoonup heta_t$ and e_c are both 500 dimensional vectors.	
	✓ Correct	
	$\ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ $	
9.	Suppose you have a 10000 word vocabulary, and are learning 500-dimensional word embeddings. The GloVe model minimizes this objective:	1 / 1 point
	$\min \sum_{i=1}^{10,000} \sum_{j=1}^{10,000} f(X_{ij}) (heta_i^T e_j + b_i + b_j' - log X_{ij})^2$	
	Which of these statements are correct? Check all that apply.	
	lacksquare The weighting function $f(.)$ must satisfy $f(0)=0.$	
	✓ Correct The weighting function helps prevent learning only from extremely common word pairs. It is not necessary that it satisfies this function.	
	igwedge hinspace hins	
	✓ Correct	
	$\ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ $	
	$igwedge X_{ij}$ is the number of times word j appears in the context of word i.	
	✓ Correct	
100	You have trained word embeddings using a text dataset of m_1 words. You are considering using these word embeddings for a language task, for which you have a separate labeled dataset of m_2 words. Keeping in mind that using word embeddings is a form of transfer learning, under which of these circumstances would you expect the word embeddings to be helpful? $ m_1 >> m_2 $ $ m_1 << m_2 $	1/1 point
	✓ Correct
